Online shoping price compression

Date:7th june 2024

Submeted by:Gogula Dinesh Teja & 22kqa10239

Details of project: I'm implementing this project by using python programming language.

Code:

online shopping price compresion

22kq1a0239

```
p1,d1,s1,p2,d2,s2,p3,d3,s3=map(int,input().split())
p3,d3,s3=map(int,input().split())
dp1=(p1/100*d1)
cp1=p1-dp1
ac1=cp1+s1
dp2=(p2/100*d2)
cp2=p2-dp2
ac2=cp2+s2
dp3=(p3/100*d3)
cp3=p3-dp3
ac3=cp3+s3
print("In flipkart:Rs",ac1)
print("In snapdeal:Rs",ac2)
print("IN amazon:Rs",ac3)
if ac1<ac2 and ac1<ac3:
  print("he will prefer flipkart")
elif ac2<ac1 and ac2<ac3:
  print("he will prefer snapdeal")
else:
  print("he will prefer amazon")
```

Input&output:

STDIN

```
1000 50 50 900 50 70 800 10 200
800 10 200
```

Output:

```
In flipkart:Rs 550.0
In snapdeal:Rs 520.0
IN amazon:Rs 920.0
he will prefer snapdeal
```

Explanation:
In this program I have implemented (online shopping price compression)which is nothing but ,in which I have taken it is an input from user displayed the output
I am comparing the price of the same product in different out lists You can find the best deals on product ,you can save money on your purchases
Comparing similar product from different stores or supplirs, The amount of a money that a buyer gives to a seller exchange for a good service.
Online shoping good services import directly from manufacturers, saving on shipping costs and middleman's commissions.
The online products may be the best place to compare offers
Conclusion:

Filally I have got the desired output

```
In flipkart:Rs 550.0
In snapdeal:Rs 520.0
IN amazon:Rs 920.0
he will prefer snapdeal
```
